DEMO-GDE-005 Synthetic Credit Channel Performance and Decision-Time Review Guide

Version: 1.0

Effective date: 1 January 2025

Owner: Synthetic Credit Operations Analytics Team

Classification: Synthetic Demo Only

1. Purpose and Scope

- This guide describes operational analysis of credit application channels using `credit_applications` only.
- It is separate from the approval and exception requirements in DEMO-POL-001.
- One record represents one synthetic application identified by `application_id`.
- The reporting time field is `application_date`.
- The covered period is 1 January 2025 through 30 September 2026.
- `application_channel` identifies Digital, Branch, or Partner.
- `customer_segment` identifies Retail, SME, or Priority.
- The permitted `region_name` values are Bali, DKI Jakarta, Jawa Barat, Jawa Tengah, Jawa Timur, and Sumatera Utara.
- `product_category` identifies Personal Loan, Working Capital, or Micro Loan.

2. Channel Performance Indicators

- Application Volume is the count of rows in the selected period and channel.
- Average Decision Time is `AVG(decision_time_hours)` within the selected population.
- The unit of Average Decision Time is hours per application.
- Approval Rate is the count of `decision_status = 'Approved'` divided by all applications in the same population, multiplied by 100.
- Rejection Rate uses the corresponding count of `decision_status = 'Rejected'` with the same denominator.
- Requested Volume is `SUM(requested_amount)` and is denominated in IDR.
- Average Credit Score is `AVG(credit_score)` and is descriptive rather than an approval rule.
- The assistant must never sum decision times and label the result as an average.

3. Comparison Method

- The analyst must specify `application_channel`, time period, and the reported denominator.
- Regional comparisons should align `region_name`, `customer_segment`, and `product_category` where practical.
- A channel with fewer observations may show greater percentage volatility.
- The analyst must state the sample size when interpreting unusually high or low rates.
- Any approval-rate difference greater than 15 percentage points versus a named comparison group triggers investigation under DEMO-POL-001.
- The comparison group must be described clearly before interpreting the difference.
- A threshold breach signals a review requirement, not a confirmed process failure.

4. Decision-Time Investigation

- Compare `AVG(decision_time_hours)` across channels over matching dates.
- Review the distribution of `decision_time_hours` instead of relying exclusively on its mean.

- Segment and product mix may differ across channels.
- The dataset contains no queue timestamps, staffing records, service-level targets, or processing-step logs.
- The assistant must not attribute a slower average to manual review, branch staffing, or system latency as a verified cause.
- A human process owner must investigate explanations using additional evidence beyond these tables.

5. Reporting and Guardrails

- The assistant may highlight channel patterns using charts or governed metrics.
- The assistant may propose questions about mix, time period, score distributions, or exceptions.
- The assistant must not approve applications or recommend an individual lending decision.
- No runtime join with `loan_quality` is authorized for channel measures.
- The data contain no customer names, NIK, card numbers, or other real PII.

Disclaimer

This document is fictional. It is not an actual bank policy or an OJK regulation. It must not be used for real credit decisions. No automated credit decision is permitted. Observed differences are correlations or descriptive patterns, not confirmed causes. Human review is required before any operational action.
